

## Overhead Crane Safety Training Cambridge

Overhead Crane Safety Training Cambridge - Overhead crane safety training equips operators with skills and knowledge about crane safety precautions, materials handling, accident avoidance, and machinery and stock protection. Trainees will learn the types of overhead cranes, their capabilities and their uses in different industry environments. For operators who are trained and licensed, the shift in liability moves to the operator from the company. Hence, the program emphasizes individual operator responsibilities.

Overhead crane safety training instructs operators in the right techniques for performing inspections. Two types of pre-shift check are the in-depth inspection and the walk-around inspection. These are important every day routines that must be logged. Correctly recorded pre-shift checks help to protect the company from liability in case of an accident. Pre-shift inspections likewise prevent expensive repairs, accidents and damage. Operators learn how to designate a particular individual to perform inspections, how to maintain the log book and how to report problems.

Each inspection must be carried out and documented on a regular basis. Things that should be inspected for possible problems, comprise: increase in the throat opening, hooks for cracks, hoist ropes for corrosion, degree of twist, worn wires, loss of diameter, broken wires, bird caging and kinks, chains for gouges and nicks, heat and chemical damage, corrosion and cracks, twists, distortion, excessive wear, pits, stretching, damage caused by extreme heat.

Operators learn right rigging procedures in this program. Rigging includes understanding the manufacturer's data plate, determining the weight of materials to be lifted, choosing the gear, and utilizing safe practices to secure the load. The course include in detail the following: safe working loads, and the capacities of chains, ropes, hooks, shackles and slings.

It is important to understand who can operate the cranes at your facility, physical requirements of the job, and operator credentials needed for specialized tasks and permits. Safety must be prioritized when utilizing near pedestrian traffic.

The responsibilities involved in the safe crane use consists of undertaking visual inspections, checking for hydraulic leaks, testing the controls, checking the safety guards, examining the hook and hoist rope, limit switches and braking mechanisms. Proper reporting procedures are critical. These topics are all covered in depth in the course.

Correct lifting and moving methods with cranes and hoists are included in the course. Operators will become competent in hand signals. Training includes how to attach the load, raise the load, abort a lift, set the load and unhook the slings.

The steps involved with moving the load, includes: stopping and starting procedures, controlling and guiding the load, working with signals and observing working conditions. In case of power failures, the operator will have to know how to proceed. The course includes techniques for removing the slings and lowering the load, storage of equipment, parking the crane, and securing an indoor and outdoor crane.
